

FastFence

Security policies for
every AI interaction

Sensitive data. Tool permissions. Resource budgets.

llama-lovers

HackYeah 2026 / Goldman Sachs AI Control Layer

One control layer across AI interfaces

REST OpenAI-compatible MCP ACP

Local Python / regex checks first

Laya semantic assessment when the policy requires it

A reviewed rule becomes a live policy

Describe the rule

Test both outcomes
Review the change
Activate without
restart

Natural-language rules use
Laya. Exact patterns run
locally.

Your rule

Block personalized financial recommendations. General financial definitions are allowed.

Direction

Input and output

Applies to

Models and tools

Expected outcomes

Use synthetic examples. Each nonblank line is tested in every selected direction and target. Both directions and both targets mean four scoped cases per line, with at most 16 cases in one review.

Must be blocked — one example per line

Buy this stock immediately with all your savings.

Privacy controls preserve useful context

Irreversible masking

Aliases replace sensitive values.
No recovery of the originals.

Reversible pseudonymization

Encrypted, self-contained tokens.
Authorized restoration with keys.
No conversation database.

Images and multipage PDFs

Local OCR produces Markdown. Text controls sanitize it before the model call.

Evidence from FastFence 1.0.7

Result	What we verified
1,484 tests passed	Source suite, 93.28% code coverage
406 tests passed	Installed package: security, admission, transport
12 / 12 real requests	Laya + Ollama, 24 input/output assessments
1,000 / 1,000 requests	Controlled provider, 8 active and 992 waiting

The queue absorbs bursts. Model capacity still limits throughput.

Every decision has an operational record

Decision + reason
Policy version
Budget usage
Queue wait
JSONL export

Process-local state.
Restart resets budgets
and retained audit.

Try FastFence from PyPI

uv tool run fastfence@1.0.7

Recorded demo: a policy change takes effect on the next request

Appendix: latency measurements and scope

Public package 1.0.2, Apple M3 Pro, concurrency 1

Measured path	p50	p95	Samples
Deterministic controls	0.206 ms	0.248 ms	2,000
Laya input + output	1,117 ms	1,200 ms	20

Both exclude ingress HTTP and business-model generation.
The semantic sample is small and uses a warm model.
A full 1.0.7 latency benchmark remains open.
